Are there any good ways to deal with content dumps, where the end user or in-game engine (such as Scriptographer) wants to use your content? I've started thinking about ways to deal with the issue, but I can't think of one that's good enough to be useful. My ideas are: create a file that contains a list of files with the name of the vendor and vendor id of each (would be global) make a full-game load method that just loops through the list of files make a scripting method that loads files by id (re)write an in-game vendor packer that then delegates to an external party get to know a scripting language that is well suited for what I want to do Which of those is the best? A: 1 is the only option, and you probably don't want to do it in a game-global list since that would clutter up your code. 2 is the approach I've been taking, since: Scriptographer isn't the only way to load content, people still use QD3D and SDL or even simple fileloading techniques. People do use Scriptographer. If you're worried about security, then allow fileloading to be specified on a per-file basis, and only allow those files with the correct security permissions. 5.6/64 bytes) c1 71 (0x44/0x70 bytes) c2 1 (0x0/0x1 bytes) c3 1 (0x0/0x1 bytes) c4 1 (0x0/0x1 bytes) c5 1 (0x0/0x1 bytes) c6 5

I followed a blog post to create a NodeJS server and added the js files to /public/ for index.html to render. The only issue is that data never shows up in the DOM. I have used HTML 5 Data Storage and I know that HTML data is not persistent across browser refreshes. I have gone through similar posts and did not see an answer to my problem. This code in the server.js file is exactly the same as what was shown in the blog post. `app.get('/form/:id', function (req, res) { var form = req.params.id; var template = path.join(__dirname, 'form.html'); fs.readFile(template, 'utf8', function (err, str) { if (err) throw err; res.render('form', { id: req.params.id, str: str }); }); });` This file is found in public/form.html Name
