PCalc offers a variety of powerful features such as built-in constants, user-defined constants, fixed-point numbers, functions, built-in operators, a memory manager, and support for textual output. PCalc has been completely reworked from the ground up for iOS, and comes with a number of great new features. Icon: (640x640) Screenshots: Requirements: My rating is based on the number of stars. 5 stars (1) 4 stars (2) 3 stars (1) 2 stars (0) 1 star (0) If your app doesn't provide these features, it's better to write one that does! You can write your own calculator, but my solution is already here. There are no known issues. With the version I've released, I would also expect to receive 2 or 3 (or more) notifications when you do something with my software. Download: If you don't have a subscription, click here to subscribe (it's totally free!) If you're a subscriber, please click here to download the latest version (0.16) Android: As Android is Google's own OS, I decided to make it available for them too. If you have Android, feel free to check out my Google Play page by clicking here Sources: Sources are included with the app, but they aren't much more than this: Name: OEP, Address, Procedure, Dump of Stack (if you want to write your own debugging utility, this is where it should start) Functions: The function in C is: int Add(int n, int m) This is exactly the same function in C++, so you should be able to write your own one if you really want to. If you can successfully compile and
