// Extension - use this in a script // using System.Linq; //... // foreach (var item in list) // { // // Do something // } You can generate IntelliSense for the created code template. Use ReSharper File - Code - Generate Code Item to generate a code template in the current file. You can also navigate to the created code template in Solution Explorer, right click on the template and select ReSharper - Refactor - Create Code Template from there. By default, the generated template is created for a namespace. You can set a different namespace name by specifying the namespace for the generated template. ReSharper allows you to generate the code template from a predefined set of extension points. These include declarations, modifiers and properties. You can access this option by ReSharper - Refactor - Generate Code Item. You can use the same code template for many different files. Just press Generate button once. If you have specified the same name for the namespace, the code template will be generated only once. After that, you can use it for multiple files, just by pressing Generate button. To generate the code template for the class, use the Generate Code Template from Current Class action. // Extension - use this in a script // using System.Linq; //... // foreach (var item in list) // { // var obj = new MyType() // { // someProperty = 123, // list = new List() { item } // }; // // Do something // } To generate the template for the given class, right click on the class in the code and select ReSharper - Refactor - Generate Code Item from the context menu. To generate the template for the method, right click on the method and select ReSharper - Refactor - Generate Code Item from the context menu. To generate the template for the field, right click on the field and select ReSharper - Refactor - Generate Code Item from the context menu. What's New in the ReSharper?

ReSharper is a comprehensive Visual Studio extension that provides support for the usage of multiple programming languages, cross-language functionality and refactoring existing scripts. The supported scripting languages include C#, VB.NET, XAML, JavaScript, TypeScript, XML, HTML, CSS, ASP.NET, ASP.NET MVC, NAnt and MSBuild. The add-in enables you to reduce the time spent defining scripts, functions and repetitive segments of code. The extension features code quality analysis for all the supported languages, which results in instantly indicating errors and offering possible solutions. You can analyze the project dependencies, build hierarchies and visualize type dependency diagrams, for in-depth comparison. You can use the Navigation tool to easily switch between projects, files, types or members in your codebase. The Find option can help you identify and replace words or entire segments of code. Moreover, you can generate advanced placeholders, in which to specify the CSS selector and the control type. ReSharper offers a large collection of annotation types that you can use to define the placeholders, such as RegexpAttribute, PathReferenceAttribute or LocalizationRequiredAttribute. The built-in decompiler allows you to view and manage referenced assemblies, by easily navigating to a certain piece of code. Several code editing tools are also available for you, including IntelliSense, code transformations, namespaces or code rearranging. Moreover, the code generation actions can automatically create properties, overloads, implementations or comparers by hand. The tool also allows you to refactor code bases without affecting the rest of the project. It is a reliable solution when handling legacy codes or when you need to restructure your project. ReSharper also supports code formatting, naming style assistance and other code preferences, which you can perform with code cleanup. From this point of view, the tool is a suitable solution for cleaning up your script and removing unnecessary segments of code.
