AutoCAD is used in a wide range of industries, including architecture, construction, civil engineering, manufacturing, retail, aerospace and defense. The AutoCAD software offers a wide variety of features for the entire design process: from drafting to technical drawing to engineering, and modeling. Autodesk AutoCAD is commonly used in construction, architecture, engineering, manufacturing and product development. This software is used for the drafting, modeling, and rendering of architectural and engineering projects. AutoCAD is also used to make 3D models of existing buildings. AutoCAD is commonly used for the construction and planning of buildings and other structures. AutoCAD is used to develop and produce structural designs for buildings and structures. These designs are often used as a guide for building contractors and engineers. In addition to architectural, civil, and mechanical engineering, AutoCAD can be used in manufacturing for design, control, and analysis. AutoCAD can be used to create computer-aided design (CAD) models of buildings and structures. These models are often used to provide a visual display of the structure, including a 3D model of the interior and exterior of the building or structure. AutoCAD is used to develop models of buildings and structures, including mechanical, electrical and plumbing (MEP) designs. These models can be used
