How do I unit-test a serial port in my Delphi project? There is this Delphi component for serial ports (Serial Port Monitor ActiveX) that seems useful, but I don't know how to write tests for it? A: How do I unit-test a serial port in my Delphi project? To test it without using the demo example in the documentation, just make the port open in the beginning and test it every time you close it. unit Unit1: interface uses Windows, Messages, SysUtils, Variants, Classes, Graphics, Controls, Forms, Dialogs, StdCtrls; type TForm1 = class(TForm) Port: TEdit; procedure PortDbClick(Sender: TObject); private public { Public declarations } end; var Form1: TForm1; implementation {\$R *.dfm} procedure TForm1.PortDbClick(Sender: TObject); begin Port.ModifyString('some string'); end; end. In many current network environments, there is a trend towards deploying storage in a distributed fashion. For example, popular storage models include distributed file systems (DFS), virtual distributed file systems (vDFS) and clustered file systems. The DFS can span multiple nodes of a network. The DFS is a distributed file system that executes a distributed file system protocol (DFS protocol) to distribute storage and file system management of data. The DFS protocol enables groups of network-attached storage (NAS) systems, operating within an enterprise's own private network, to appear to the operating system, to which they are attached, as a single, virtualized storage system. The vDFS is a virtualized distributed file system that is similar to the DFS in that the vDFS includes the ability for multiple network-attached storage systems to appear to the operating system, to which they are attached, as a single, virtualized storage system. Additionally, the vDFS enables shared access to storage resources. The clustered file system, also referred to as cluster file system, provides distributed file system features to NAS systems, such as read-only servers, that are "clustered"
