## **Unformat Serial Number ##HOT##**

# Download

When using the UNFORMAT function, it allows you to turn off the special characters that were imported from the original data source. An example of this would be in a cell that has a date that has "CDY" as the format.

Without this option turned on, the text would be turned to #####. So, by making sure that the UNFORMAT function has this special turned off, it will remain in its original format. NOTE: that you also must use the PICTURE function as well. Also, when using the UNFORMAT function, there are actually two functions being used; UNFORMAT Function (equivalent to the PICTURE function) and UNFORMAT Table (equivalent to the SHOWTABLE function). Both functions do the same thing, but only the UNFORMAT function has the additional parameters. I am using Microsoft Excel 2003 and have a 'Formatted' field that is a date. If I try to apply the UNFORMAT function to the field, it says the it does not exist. However, my data table does have 'Unformatted' so it should not be an issue. What am I doing wrong? I am trying to un-format an imported serial number and am using Microsoft Excel 2003. When I try to un-format the date it keeps the 24-hour format. I tried using the DATEVALUE function and that does not correct it. What could be causing this? If you only have one date format, then it doesn't matter because all serial number formats will have the exact same sort order, no matter what day your date is. However, when you have multiple date formats, their sort order depends on the other date formats. And this is why your app is working, for sure. You have one date format and it is not dependent on the other date format. So the date-only format seems to have been defined after the serial number format.

## **Unformat Serial Number**

Hi, Your date format is wrong. You need to format as a number or text, not as date. Format as text and this is what you will see:  
<https://t.co/7nfnSg6sqY> NOTE I only posted the text that appears, do not

forget to copy and paste David is right - the date is stored as a number in the cell. The only way you can find out what the number value is is to use an advanced formula like he gave you. For the VLOOKUP you need to set the format of the column to your Date format Thanks for the response.

Following your advice I formatted the date as a number in the cell, then used the formula: =TEXT(VALUE(F2), "dd/mm/yyyy") My sample is here:

<https://t.co/JqxX7pnd5E> Unfortunately it is still giving me the #VALUE error. Any ideas please? In Excel, the date in a cell is stored as a number. The way to change it is to format the cell as a text, not as a date. If you format the cell as a date, you will only see the date part and not the number. For example, if you format this cell as a date, you will only see the date. I have a text file, I wanted to put it in to a spreadsheet as the date and put it in a cell, but it keeps saying #VALUE! This is what I have done: =SUBSTITUTE(VALUE(F2),"/","","") But, it only puts the date in it, not the number! Is there a reason why it is doing this? Hi David, If you choose to sort a worksheet by date in ascending order, by default the days will be displayed as dd. The way you display the days will depend on how you've configured the number format for the date, but you can use the COUNT() function to determine the number of days in the month. (The %d format includes day of week but you can get the number of days in a month by using the COUNT(MONTH()) function, or the number of days in the year by using the COUNT(YEAR()) function. 5ec8ef588b
