Use an air cleaner or an air filter that is attached to the air cleaner to capture airborne particles or particles that are suspended in the air. The air filters that are used in air cleaners or that are sold separately are intended to be changed from time to time. If a filter or filter component becomes clogged, the filter will need to be replaced. Office building air circulation problems can result in an increased concentration of indoor air pollutants such as VOCs. Thermal and air conditioning ducts (and exhaust fans) are major factors. The indoor air quality is significantly affected by the amount of outdoor air infiltration and the ability of the building to effectively and efficiently remove indoor air pollutants and/or control indoor air pollutants. One way to improve duct and air circulation is to block all outside air from entering, installing duct sealing products, and not raising or lowering windows. If you are located in an area with a high level of air pollution (smog), consider installing an air exchanger. Air exchangers are devices that condition air and supply it to the living space. They can be used to reduce the concentration of indoor pollutants, such as formaldehyde, radon, and tobacco smoke, and keep contaminants from entering the home. Ventilation and filtration are the two primary means of controlling indoor air pollution. If indoor air quality is of concern, steps must be taken to improve the quality of the indoor air. Applying a healthful, comfortable environment requires a thorough understanding of the current indoor air quality, as well as what is needed to improve it.

The Environmental Protection Agency (EPA) has addressed the problem of indoor air quality by issuing regulations for regulating the emissions of the principal indoor air pollutants, including hazardous chemicals, radon, volatile organic compounds, carbon monoxide, and airborne particulates. These regulations have resulted in a tremendous increase in the technological capabilities to test air quality. Many office buildings have significant air pollution sources. These include building devices (computers, photocopiers, etc.) that emit chemicals and waste. (See article for reasons for poor indoor air quality.) It is possible to have some controls installed in an office or apartment in order to help address indoor air problems. The first step is to conduct a complete evaluation of the ventilation system. Next, install the proper building controls. If an indoor air quality system is not installed in the first place, your first step should be to have the offending sources of indoor air pollution removed. > Open windows in rooms without people to allow fresh, outdoor

air to enter and replace polluted air. During the colder months when the temperature is below freezing, you may be able to leave windows open to provide natural ventilation. If this is not practical, open the windows to allow outdoor air to enter and remove smoke and other pollutants that accumulate during cold weather. If you live in an apartment or office building with poor indoor air quality, you may be able to correct the problem yourself. Some of the steps you can take to improve your indoor air quality include: 5ec8ef588b
